(54) Title: METHOD AND APPARATUS FOR REMOTELY CONTROL OF ELECTRONIC APPARATUS

(57) Abstract: A system and method for using a service discovery device to enable communication between devices within a home network and a remote device. An IP address is provided to each device located within the home network. After the service discovery device makes at least one HTTP request to each of the IP addresses, the service discovery device receives information from a HTML page on each of the devices. A web page is then generated that contains the received information. The generated web page is accessible from the remote device, and the generated web page includes a list of links to device web pages for each of the devices located within the home network.
